In applied mechanics, bending (also known as flexure) characterizes the behavior of a slender structural element subjected to an external load applied perpendicularly to a longitudinal axis of the element.

In engineering, deflection is the degree to which a structural element is displaced under a load. It may refer to an angle or a distance. The deflection distance of a member under a load is directly related to the slope of the deflected shape of the member under that load, and can be calculated by integrating the function that mathematically ...

En ingenierÃ-a, se llama resiliencia de un material a la energÃ-a de deformaciÃ³n (por unidad de volumen) que puede ser recuperada de un cuerpo deformado cuando cesa el esfuerzo que causa la deformaciÃ³n.
